We were quite busy with other projects and classes so we only started to work on the sprint from March 1st and on. During our meeting on March 1st, we identified additional subtasks under each main task for the sprint, so we readjusted both the point values and the number of issues to be resolved during the sprint. We most actively worked on and resolved issues during the second half of the sprint, but our pace was not very fast for the first few days, but after we finished our other projects, we spent significantly more time and effort on this project and vastly accelerated our progress during the final 2 days. On march 11th, we had to resolve a couple of bugs so we made subtasks for those bugs and assigned point values to them.

Jira was down during the beginning of the sprint, so the point values for the sprint in the very beginning were not set, so the guideline is not there, assuming there is a diagonal line from the top of march 1st to the bottom of march 12th, our sprint velocity was alright. We made slow and steady progress for one week, and then focussed heavily on completing all tasks the final few days.

Compared to the previous sprint, our burndown chart for sprint 3 is much more consistent, as for the last sprint, we did everything the last day.
